

Vendtec Cape is one of the only companies offering a cashless vending service for vending machines including hot beverage vending machines. For control of coffees and teas companies are more and more outsourcing this type of service and this is where MVS can offer the company a controlled environment for dispensing of hot beverage to their staff. By installing the COGES Cashless Key/Card system we are able to provide the employees with "Free Sales" per day according to what the employer decides. These free cups of coffee are allocated to each employee upon insertion of the key or card into the vending machine and should they wish to have more than their allocated free cups, they may purchase extra cups. What is unique with this system is it can be used on all existing vending equipment on the clients premises thereby creating a cashless environment for the employees.

MyKey is a new electronic cashless key which uses a sophisticated transponder technology and which is able to store some personal information, among which the credit amount. It is enough to insert the cashless key in a special Flex Reader or Point TS Reader and charge it by inserting some cash. From that moment on the cashless MyKey key will replace the use of cash in all the vending machines managed by the same Operator and will be used for purchasing products or any desired service: at each purchase the cost of the product will be decreased from the credit charged, till it is used up. The cashless MyKey key can be recharged at any moment and in any vending machine equipped with a device for cash validation, or using a special terminal. This operation can be always carried out in autonomous way by the User.

**SAFE:** Thanks to the transponder technology (a radio frequency identification), MyKey contactless key makes the transactions extremely safe and confidential. MyKey differs from the other cashless keys as the exchange of information between key and reader does not take place by means of a direct physical contact, but by radio frequency transmission.

**PRACTICAL:** Very easy to use, MyKey cashless key works as the well-known E.C.S. CL key, to recharge it is enough to insert it in the Point TS reader or Flex Reader key and card reader, included in all Coges electronic payment systems of new generation.

**RELIABLE:** Reliability and the highest quality levels coming from 30 years of Coges experience in manufacturing cash and cashless payment systems.

**TECHNICAL SPECIFICATIONS:** The data transmission between contactless keys and reader occurs in radio-frequency, guaranteeing thus a high degree of data safety. Each electronic cashless key has a univocal identification code which makes MyKey exclusive and inimitable. Its memory area is divided in sections to which two different access codes are assigned. MyKey permits the automatic management of deposits. The key is autonomously enabled when the amount inserted by the user exceeds the deposit amount.

**TRANSACTION MANAGEMENT:** To favour a better control of the vending machine MyKey cashless key can store the last 8 transactions carried out.

**APPLICATIONS:** MyKey cashless key is perfectly compatible with Coges electronic payment systems and can be used with every cashless system equipped with Point TS or Flex Reader.

Cashless Vending offers a unique opportunity for companies to control their staff spend and can be refitted across various machines e.g. snack, hot beverage and cold drink, all via the "My Key System". Manage the whole system via the software supplied by KDataPlus.

### **Contactless Electronic Payment Systems**

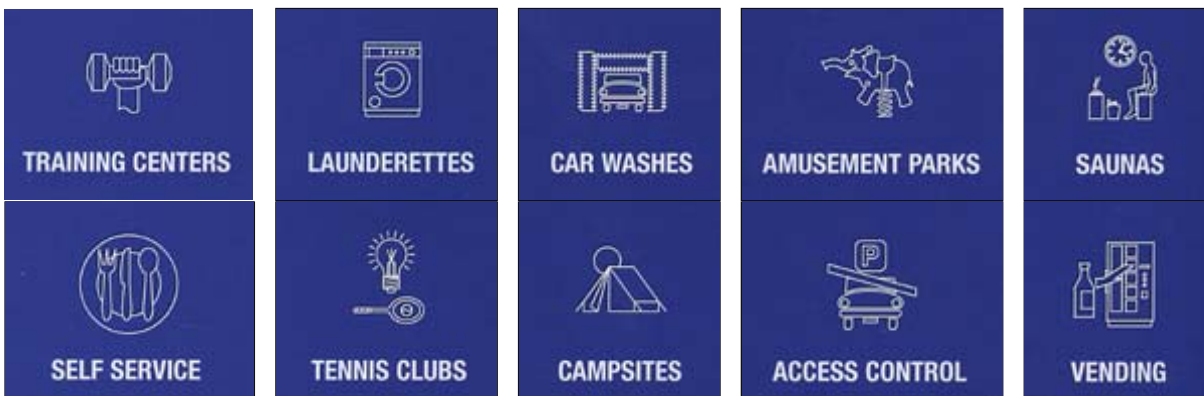

Contactless Electronic Payment Systems by key or card, for simple, reliable management of purchases from automatic vending machines. E.C.S. has long been a synonym of technology and security at the service of vending.

With a cashless payment system, the operator can improve his image toward the customer, increase sales, optimize economic management and achieve greater control of accounting data and transactions.

**Advantages**

- Easy to use
- Secure
- Reliable and resistant
- Advance credit encashment (Pre - Paid)
- Different prices for cash and cashless
- Multiple price tables
- Control of accounting data
- Management of transactions
- The user is more inclined to buy
- Integrated non - vending solutions
- Management of business promotions (bonus, happy hour, time bands...)

**E.C.S. Program-Key**

Contactless electronic key for automated management of payment systems.

**E.C.S. Softkey**

Key for updating payment systems firmware.  
Saves replacement of electronic board components.

### E.C.S. Data Key

Contactless electronic key for collection accounting data.

### Software: KDatiPlus

KDatiPlus is software for collecting and analysing accounting data and transactions made in devices fitted with Coges payment systems.

### Software: Visual Programmer

**Visual Programmer** is software for managing the setup parameters for Points of Sale equipped with **Coges Payment Systems**.

The Program-Key and K4U Analyzer is used for programming.
